

# Commander

The number of applications for in-vehicle Mobile Data Terminals is increasing year on year, and there is a need for an intelligent mechanism to assist in switching between and managing these applications. In addition, some applications will show dialogs on top of the current screen whilst other software will automatically bring itself to the front of the screen, irrespective of what application is currently running.

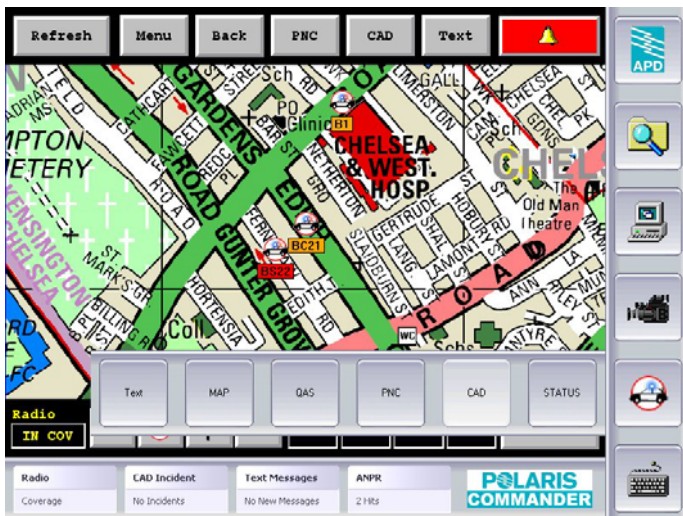

Designed to offer greater hardware utilisation and flexibility, POLARIS Commander acts as a common 'Windows Environment', launching and managing a wide range of applications, whilst providing a consistent front end for all users.

Database look-ups such as national and local intelligence sources, 3rd party applications, browser facilities and integration with APD systems are accessible through this common launch medium.

## Running on a Windows Platform, POLARIS Commander provides:

- Single secure log on facility
- "Constantly Visible" Navigation Bar, incorporating a range of emergency buttons and a list of running tasks
- Division of the platform's resources ensure that all applications are able to run efficiently
- Management of "keep on top" software, by creating and assigning a separate desktop to ensure GUI isolation between applications
